XpressMyco PCR Detection Kit

Catalog No.: XMYC3-50

List of *Mollicute* Strains Detected

About a quarter of all animal cell cultures are contaminated with Mycoplasma/Mollicutes. The most commonly found strains in cell cultures with a total probability of 94% are: *M. fermentans* (47%), *M. hyorhinis* (19%), *M. orale* (10%), *M. arginini* (9%), *A. laidlawii* (6%) and *M. hominis* (3%). In addition, the following strains were found with lower probability: *M. bovis*, *M. pneumoniae*, *M. salivarium* and *M. synoviae*. All of these Mollicutes strains are detected by the Mycoplasma PCR Detection Kit, in addition to a variety of other strains. The verification of the primer specificity was carried out by BLAST analysis.
